

What changed after review?

Keep the calculation, supporting files and review reference together. Then compare later files with the exact package retained for review.

1. Assemble one review package

Statement summary + ledger summary + reconciling items + assumptions + review notes + calculation + **simulated approval**.

In this example, a fictional finance reviewer is associated with the original package. The approval record refers to those exact file versions.

2. Compare later versions

USD - period ended 30 Jun 2026	Original	Revision A	Revision B
Statement balance	\$125,000.00	\$125,000.00	\$125,000.00
Add: deposits in transit	\$4,000.00	\$4,000.00	\$4,500.00
Less: outstanding payments	\$5,500.00	\$5,000.00	\$6,000.00
Adjusted statement balance	\$123,500.00	\$124,000.00	\$123,500.00
Ledger balance	\$123,500.00	\$123,500.00	\$123,500.00
Unexplained difference	\$0.00	\$500.00	\$0.00

MATCHES PACKAGE

Original files match the retained package. Difference: \$0.

CHANGE FLAGGED

Payments changed by \$500. The calculation now differs by \$500.

CHANGE FLAGGED

Two supporting amounts changed. It still balances, but the package is different.

A reconciliation can still balance even though its supporting files have changed.

In both revisions, the original simulated approval no longer matches the current package. The changes can be surfaced for review instead of silently treating the revised files as the earlier reviewed version.

What this example establishes: whether presented files match a retained package. All amounts, notes and approvals are made up. It does not authenticate a real approval, prove a review occurred, or establish trusted approval time. Real use would require connections to the source systems and an actual approval process.
